

Understanding the applicability of the WELL Building standard to UBC's academic context

Prepared by: Mina Parsian, UBC Sustainability Scholar, 2018 Prepared for: Angelique Pilon, UBC Sustainability Initiative

Penny Martyn, UBC Sustainability & Engineering Department

August 2018

Executive summary

This project will contribute to UBC's growing body of information on building design principles that support health and wellbeing, as well as greater understanding of the feasibility of utilizing a health focused building standard tool, like the WELL Building Standard, in the UBC context. The results will be used to inform the development of UBC's Green Building Plan and further academic research, and support strategies such as the Okanagan Charter and the 20-year Sustainability Strategy. This project is divided to three sections in which the WELL Building standard, three buildings on Vancouver campus as case studies, and UBC guidelines are analyzed.

The first part the study focused on the International WELL Building Institute (IWBI), WELL Building standard, WELL v2, and its checklist. IWBI is a leading organization in the global movement to transform buildings and communities in ways that help people thrive. The WELL Building standard is a tool and rating system developed by IWBI focused exclusively on the ways that buildings and everything in them, can improve occupant's comfort, drive better choices, and generally enhance, not compromise, health and wellness of the occupants. The WELL v2 pilot is the most recently launched version of its WELL Building Standard consisting of 112 features organized into ten large concepts: air, water, nourishment, light, movement, thermal comfort, sound, materials, mind, and community.

Then, in the second part of the project the focus is on three different academic buildings at UBC: Center for Interactive Research on Sustainability (CIRS), Life Sciences Centre (LSC) and Forestry Sciences Centre (FSC). Each one of these buildings were best practices at the time they were built. The main reason of this selection is to test the WELL Building standard in different institutional buildings and see how it's working within a variety of buildings with different design and programming. CIRS, completed in 2011, has become a hub for sustainability at UBC and has achieved CaGBC's LEED Platinum certification and obtained

a number of sustainability and high-performance awards. Life Sciences Centre, built in 2004, is a LEED Gold certified building incorporating dry and wet labs focusing on research including anatomy, biochemistry, molecular biology, cell biology, medical genetics, and bio-informatics. Last, the oldest amongst all three buildings, is Forestry Sciences Centre, built in 1998 designed to showcase construction using Canadian forest products.

The WELL Building standard provides checklists requiring different type of documents. WELL requires projects to provide documentation as evidence that certain WELL features are met such as annotated documents, letters of assurance, photographs, and general documents. For existing buildings such as the selected ones at UBC Vancouver campus, all documents provided by the architect, mechanical, electrical, and pluming engineers, and contractor are on UBC's infrastructure development website, in the records section. 40% or 80 parts of all the features are related to decisions and policies made at different stages of building design such as design and operation phases. Five out of these 88 parts are policies affecting the physical building design. 29% of 112 features are related to how the building is designed and the rest are both policy and design oriented.

All available documentation for each building was studied and analyzed in order to assess the performance of each building according to the WELL checklist; however, this assessment is not necessarily aligned with their success in being WELL certified but their success in addressing the Standard's features and providing the required documentation. The CIRS building demonstrates a better performance by providing documentation for 72 features related to both policy and design. LSC and FSC show a similar performance by providing documentation for 47 and 41 features.

The majority of features not found in all three buildings are in the materials and community concepts. However, CIRS building is showing a far better documentation in air, light, and materials concepts that might lead to successfully obtaining points for those features. All buildings are showing a similar performance in keeping track of documentation addressing mind concept since most of these features are

addressed by UBC policies. All three buildings are showing a similar performance in addressing community features such as "health and wellness awareness", "occupant survey", "family support", and so on due to being part of UBC as the context.

The last part of the study concentrates on providing recommendations for UBC and how it can develop its guidelines and policies to demonstrate a better performance within WELL Building Standard. Having an integrated design process, adding policies regarding mind and community concept, modifying technical guidelines to reach the level of interior quality required by WELL are part of these recommendations.

Summary List of recommendations

- Follow Integrated design process for new constructions on campus for a better collaboration among all parties and having a more efficient WELL certification process.
- Add WELL features especially in movement, mind, and community concepts to different UBC
 design and policy guidelines such as "Vancouver Campus Plan" and "UBC's action framework
 to increase physical activity and reduce sedentary behavior" since UBC is already addressing
 some of them.
- Consider publishing a UBC WELL implementation guide aligned with UBC LEED implementation guideline or incorporate WELL features into the LEED implementation guideline to be used in the planning and design of new projects on campus.
- Add WELL features focusing on materials concept such as "fundamental Material Precautions", "Volatile Compound Reduction", and the like to the Green Building Plan since it already includes the materials and resources category.
- Modify UBC technical guidelines since they are addressing many WELL features but not to the same level required by WELL Building Standard.
- Generate one researchable plenary database to better keep track of all documentation required by WELL

Introduction

The goal of this study is to better support the health and wellbeing of UBC faculty, staff and students, through improved design and operation of campus academic buildings. In this project the applicability of WELL Building standard to three different UBC faculty buildings is studied. Three different buildings - Center for Interactive Research on Sustainability, Life Sciences Centre and Forestry Sciences Centre- were chosen due to their different characteristics and programs. Each one of these buildings were best practices at the time they were built. The main reason of this selection is to test the WELL Building standard in different institutional buildings and see how it's working within a variety of buildings with different design and programming. These academic buildings are being used as theoretical case studies to test the feasibility and applicability of the standard to a university context in general, and UBC in particular.

This project will contribute to UBC's growing body of information on building design principles that support health and wellbeing, as well as greater understanding of the feasibility of utilizing a health focused building standard tool, like the WELL Building Standard, in the UBC context. The results will be used to inform the development of UBC's Green Building Plan and further academic research, and support strategies such as the Okanagan Charter and the 20-year Sustainability Strategy. The results will also help inform decisions on ways to engage with the WELL Building standard and its supporting organization, the international WELL Building institute, and will provide the groundwork for further academic research and partnerships around the topic of human health and the build environment.

The WELL Building Standard is a new building certification tool that seeks to optimize building design and occupational practices to advance human health and wellbeing outcomes, by assessing performance in ten categories: air, water, nourishment, light, movement, thermal comfort, sound, materials, mind, and community. The scope of this research study is not to assess the performance of the chosen buildings in these categories but to first understand the WELL Building Standard's feasibility of UBC's institutional context, the accessibility of different data collections that the standard requires and then to investigate if

this is the most effective approach to achieve a healthy environment for the wellbeing of UBC's faculty, staff, and students.

IWBI – International WELL Building Institute

The International WELL Building Institute (IWBI) is a leading organization in the global movement to transform buildings and communities in ways that help people thrive. The WELL v2 pilot is the most recently launched version of its popular WELL Building Standard, which will continue to enhance building design and especially interior environment, and the WELL Community Standard pilot, a district scale rating system that sets a new global benchmark for healthy communities. WELL is focused exclusively on the ways that buildings and communities, and everything in them, can improve occupants' comfort, drive better choices, and generally enhance, not compromise, health and wellness of the community. IWBI convenes and mobilizes the wellness community through management of the WELL AP credential for practitioners, the pursuit of applicable research, the development of educational resources, and advocacy for policies that promote health and wellness everywhere.¹

WELL v2: Equitable, Local, Dynamic²

WELL v2 builds upon WELL v1, drawing from the community of users and practitioners, and from health and building researchers and experts around the world. One of the main goals in developing WELL v2 is to drive equity into the very architecture of the standard. WELL v2 seems to be more approachable by reducing barriers to entry, while maintaining WELL as a mark of true leadership. This version offers more choice while retaining rigor and this is done by re-affirming and building upon the scientific evidence base for effective health intervention through built spaces and organizational practices, homing in on the essential elements of what a healthy building must be and introducing new options for what a healthy building could be.

¹ https://www.wellcertified.com/en/articles/iwbi-launches-well-v2

² https://v2.wellcertified.com/v2.1/en/overview

"WELL is already a global tool being utilized in more than 30 countries. In order to make WELL v2 a better fit for people and spaces around the world, IWBI approached the goal of globalization through a strategy of localization; taking into consideration regional health concerns, cultural norms and market realities. This new version of WELL will be regularly and proactively adapted to varying contexts and constructs, making it even more relevant and readily applicable to spaces and places across the globe."

IWBI built a system that can continuously learn, evolve and improve and that's why WELL v2 is dynamic. Moving away from a fixed scorecard gives the opportunity to focus on the outcomes that matter most for the project and community, and it gives the opportunity to regularly introduce new pathways and parts to make WELL a better fit for all buildings everywhere.

The Architecture of the Standard

WELL v2 consolidates previous iterations and pilots into one WELL standard applicable to any types of building or community development project. "The system is designed to grow in specificity and specialty over time, adapting to accommodate diverse project types and geographies and in response to new evidence and ever-evolving public health imperatives." In order to maintain status as a WELL Certified project, projects must adhere to reporting requirements such as results of occupancy surveys, proof of maintenance, and ongoing monitoring of environmental parameters like air and water quality. These features generally require report submission on annual basis and this might take to documentation over 3 years of operations.

Ten Concepts

There are ten concepts in WELL v2: Air, Water, Nourishment, Light, Movement, Thermal Comfort, Sound, Materials, Mind and Community. Each concept is comprised of features with distinct health intents. Features are either preconditions or optimizations.

Universal Preconditions

Preconditions define the fundamental components of WELL certification and serve as the foundation of a healthy building. WELL v2 offers a single set of preconditions for all projects. All the preconditions are mandatory for project certification and all parts of the preconditions are mandatory.

Flexible Optimizations

Optimizations are optional pathways for projects to demonstrate achievement in WELL. Project teams choose the optimizations they want to pursue. Further, projects may choose which parts to pursue within optimizations up to the point maximum established for the optimization.

Meaningful Weightings

WELL v2 operates on a points-based system, with a total of 110 points available to each project. All optimizations have maximum point-values. The point-value of a feature is determined by its potential for impact. This is defined as the extent to which a feature addresses a specific health and wellness concern or opportunity for health promotion, and the potential impact of effective intervention.

Accommodating All Space Types

All parts of WELL v2 are designated for specific space types. Space types in WELL refer to spaces within a project such as office spaces, common areas, and so on. These space types do not refer to the project as a whole. Many parts in WELL are denoted for "all spaces", which indicates that the part must be applied to all spaces within the project, for all project types such as features in air, water, light concepts, and so on. Some features list distinct parts for specific space types such as eating spaces, restrooms, and so on; depending on the part, these additional requirements may be required on top of the requirements for all spaces or used in place of the requirements listed for all other spaces.

Scoring and Certification Levels

Projects must achieve all preconditions as well as a certain number of optimizations to earn different levels of certification:

WELL Silver Certification: 50 points.

- WELL Gold Certification: 60 points.
- WELL Platinum Certification: 80 points.

To be certified projects must earn a minimum of two points per concept and no concept can be disregarded. Projects may earn no more than 12 points per concept through both preconditions and optimizations. At the point of submitting for Documentation Review, projects may submit a scorecard that contains up to 100 points worth of features. Projects can also add on an additional ten points for Innovation to their scorecard.

Concepts and Features³

10 Concepts 23 Preconditions required 94 Optimizations available

Concepts in the WELL v2 Building Standard:

1. Air - 4 Preconditions / 10 Optimizations

The WELL Air concept aims to ensure high levels of indoor air quality across a building's lifetime through diverse strategies that include source elimination or reduction, active and passive building design and operation strategies and human behavior interventions.

2. Water - 3 Preconditions / 5 Optimizations

The WELL Water concept covers aspects of the quality, distribution and control of liquid water in a building. It includes features that address the availability and contaminant thresholds of drinking water, as well as features targeting the management of water to avoid damage to building materials and environmental conditions.

3. Nourishment - 2 Preconditions / 11 Optimizations

The WELL Nourishment concept requires the availability of fruits and vegetables and nutritional transparency and encourages the creation of food environments where the healthiest choice is the easiest choice.

4. Light - 2 Preconditions / 6 Optimizations

The WELL Light concept promotes exposure to light and aims to create lighting environments that are optimal for visual, mental and biological health.

5. Movement - 2 Preconditions / 10 Optimizations

The WELL Movement concept promotes movement, physical activity and active living and discourages sedentary behaviors through environmental design strategies, programs and policies.

6. Thermal comfort - 1 Preconditions / 6 Optimizations

The WELL Thermal Comfort concept aims to promote human productivity and ensure a maximum level of thermal comfort among all building users through improved HVAC system design and control and by meeting individual thermal preferences.

³ https://v2.wellcertified.com/v2.1/en/concepts

7. Sound - 1 Preconditions / 4 Optimizations

The WELL Sound concept aims to bolster occupant health and well-being through the identification and mitigation of acoustical comfort parameters that shape occupant experiences in the built environment.

8. Materials - 3 Preconditions / 11 Optimizations

The WELL Materials concept aims to reduce human exposure to hazardous building material ingredients through the restriction or elimination of compounds or products known to be toxic and the promotion of safer replacements. Compounds known to be hazardous to the health of occupational workers and/or known to bioaccumulate or aggregate in the environment are also restricted and, in some instances, not permitted.

9. Mind - 2 Preconditions / 13 Optimizations

The WELL Mind concept promotes mental health through policy, program and design strategies that seek to address the diverse factors that influence cognitive and emotional well-being.

10. Community - 3 Preconditions / 13 Optimizations

The WELL Community concept aims to support access to essential healthcare, workplace health promotion and accommodations for new parents while establishing an inclusive, integrated community through social equity, civic engagement and accessible design.

11. Innovation - 0 Preconditions / 5 Optimizations

Innovation features pave the way for projects to develop unique strategies for creating healthy environments.

Crosswalks & Alignments⁴

The International WELL Building Institute (IWBI) recognizes and values the complementary nature of green building and building for occupant health and wellness. To support projects pursuing both the WELL Building Standard (WELL) and leading green building standards from around the world, the IWBI is putting forth WELL Crosswalks.

Crosswalks are intended to identify alignments between WELL and other green building standards, such as LEED, Living Building Challenge, and so on. Crosswalks identify WELL features and requirements in sync with other standards for projects seeking a dual certification by acknowledging where WELL Building Standard requirements are deemed equivalent and aligned with aspects of the alternate building rating tool.

LEED⁵

LEED and WELL Building Standard can be used together to ensure buildings and its operation value energy and resources to have a brighter and more equitable future while addressing occupant's health and well-being for them to thrive and demonstrate a better performance. Both WELL and LEED are administered by Green Business Certification Inc. (GBCI). Both complement each other in the optimization of healthy and high-performance environments. IWBI welcomes projects to pursue LEED alongside WELL in order to promote both environmental sustainability and human health. LEED certification is important for achieving the best possible outcomes for environmental sustainability, and WELL maximizes the potential for supporting human health and wellness.

The International WELL Building Institute, US Green Building Council and Green Business Certification Inc. have developed the following charts to show the compatibility of WELL Building Standard with LEED

http://standard.wellcertified.com/well-crosswalks?_ga=2.21359163.1806589131.1531080716-1388703945.1526418228

⁵ https://www.wellcertified.com/en/resources/leed-well-crosswalk-2017

v2/v3 and v4. These charts identify features and measures required by WELL that are completely or to some extend addressed by LEED features. The following crosswalk documents outline where achievement of LEED credits and WELL features will provide achievement of a credit or feature in the corresponding program.

Canada and the WELL Building Standard⁶

As mentioned, WELL building Standard is an international leading standard addressing interior environment and how it would affect the health and well-being of the occupants. In Canada, the Canada Green Building Council has been collaborating with Green Business Certification Inc. (GBCI) to promote and advance WELL in Canada. The first Canadian organization pursuing WELL certification in form of a New and Existing Interiors project was TD Bank Group in 2015. Canada stands among leading countries addressing the health and well-being of building occupants through WELL certification. There are 38 projects in Canada already certified or pursuing WELL certification.

Case Studies

UBC Academic Buildings

Three different buildings - Centre for Interactive Research on Sustainability, Life Sciences Centre and Forestry Sciences Centre- were chosen due to their different characteristics and programs. Each one of these buildings were utilized best practices in design and construction at the time they were built. The main reason of this selection is to test the WELL Building standard in different institutional buildings and see how it's working within a variety of buildings with different designs and programming. These academic buildings are being used as theoretical case studies to test the feasibility and applicability of the standard to a university context in general, and UBC in particular.

1. The CIRS Building⁷

CIRS was first conceived in 1999 by Dr. John Robinson, a professor at UBC, as an opportunity to create a sustainability showcase in the province of British Columbia: a building in which to push the envelope of sustainable design by integrating passive design strategies with the most advanced sustainable technologies of the time to achieve a high-performance building.

Completed in 2011, CIRS has become a hub for sustainability at UBC. The 4-storey building has a gross area of 5,675 m2 (61,085 ft2), which includes offices and labs, a 425-seat auditorium, meeting rooms, The Loop Café and open spaces for studying and social interaction. It has achieved CaGBC's LEED Platinum certification and obtained a number of sustainability and high-performance awards.

CIRS was the first demonstration project of UBC's Campus as a Living Laboratory Initiative. The building systems and infrastructure, as well as the process of planning, designing, building and operating the facility are part of an ongoing research program. CIRS is equipped with a robust network of sensors and controls

18

⁷ http://cirs.ubc.ca/building/building-overview/

to ensure that all systems are properly monitored to facilitate performance tracking and reporting, to enable the implementation of continuous optimization protocols, and to collect data for a variety of research projects.

2.Life Sciences Centre

The UBC Life Sciences Centre (LSC) has been awarded the prestigious Leadership in Energy and Environmental Design (LEED) Gold certification by the United States Green Building Council for its innovative sustainability features. ⁸ The UBC Life Sciences Centre provides a variety of teaching and research facilities for the study of life sciences as well as medical student training at the university. Also, there are plenty of open spaces for studying and social interactions.

_

⁸ http://news.ubc.ca/2006/01/09/archive-media-releases-2006-mr-06-004/

The facility focuses on research including anatomy, biochemistry, molecular biology, cell biology, medical genetics, and bio-informatics. Flexible wet and dry research lab modules and associated support spaces are distributed along three wings each five storeys high and connected by two full height atria. Large auditoria, classrooms and specialized teaching spaces front the main east-west colonnade at grade. The east atrium is defined by a café and food services area and provides an informal assembly hall. The west atrium has study tables and modulated lighting to create a quiet reading room.⁹

3. Forestry Sciences Centre

The Forest Sciences Centre was completed in 1998 for UBC's Faculty of Forestry and was designed to showcase construction using Canadian forest products. The 17,505-square-metre Forest Sciences Centre has 11 classrooms, 2 lecture theatres, teaching laboratories, office space, computer labs, study areas, and a cafeteria and houses the Faculty's three departments. ¹⁰ The Forest Sciences Centre was designed as three distinct blocks to meet the B.C. Building Code regulations at the time of construction. These consist of a four-story laboratory block, a four-story office block, and a two-story wood processing center, all of which

⁹ https://dsai.ca/projects/life-sciences-centre-university-of-british-columbia/

¹⁰ http://www.forestry.ubc.ca/general-information/forest-sciences-centre/

surround a large central sky-lit atrium. Each of the three blocks are separated by seismic joints and fire barriers, and have a distinct structure and design that was driven by their specific functional needs.¹¹

 $^{^{11}\} http://www.forestry.ubc.ca/general-information/forest-sciences-centre/uses-of-wood-in-the-forest-science-centre/uses-of-wood-centre/uses-of-wood-in-the-forest-science-centre/uses-of-wood-in$

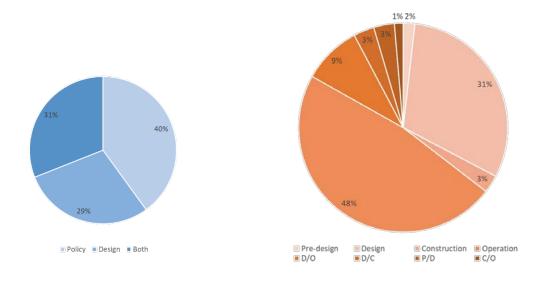

Case study analysis

The WELL Building standard provides checklists requiring different type of documents. For existing buildings such as the selected ones at UBC Vancouver campus, all documents provided by the architect, mechanical, electrical, and pluming engineers, and contractor are on UBC's infrastructure development website, in the records section. For new constructions applying for WELL certification however, there are additional responsible parties such as project administrator, owner, WELL Accredited Professional, and WELL Coaching Contacts.

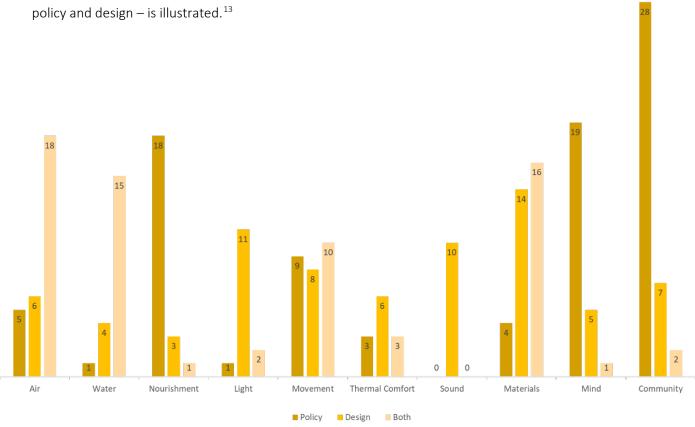

WELL requires projects to provide documentation as evidence that certain WELL features are met such as annotated documents, letters of assurance, photographs, and general documents. ¹² 40% or 80 parts of all the features are related to decisions and policies made at different stages of building design such as design and operation phases. Five out of these 88 parts are policies affecting the physical building design. 29% of 112 features are related to how the building is designed and the rest are both policy and design oriented.

For every document required in WELL checklist, there is a preferred time to obtain the specific document. If building design is divided to four categories – pre-design, design, construction, and operation – 2% during pre-design, 31% during design, 3% during construction, and 48% of all features are assessed during operation phase of building design. However, there are features in need of documentation during two phases and are overlapping. 9% of 112 features are in need of documentation at both design and operation, 3% at both design and construction, 3% at both pre-design and design, and finally 1% at both construction and operation.

¹² WELL certification guidebook

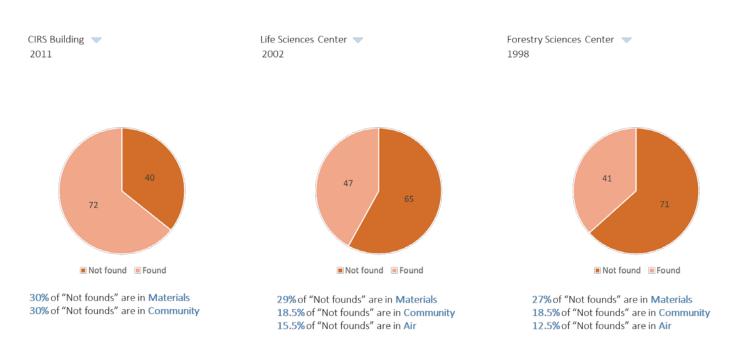

As mentioned before, WELL has 10 concepts – air, water, nourishment, light, movement, thermal comfort, sound, materials, mind, and community – and in each concept there are features consisting several parts to account for. In the chart provided below the detailed study of the nature of these parts –

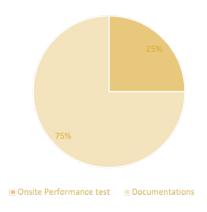

¹³ Appendix X

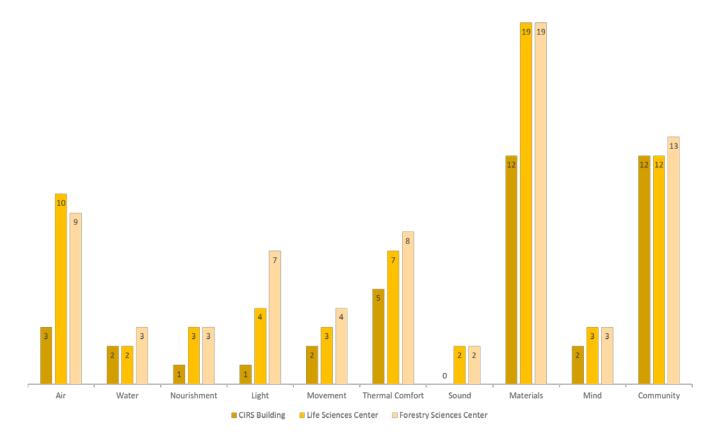

The selected buildings – CIRS building (2011), Life Sciences Centre (2002), and Forestry Sciences Centre (1998) – were best practices at the time they were built. Some documents in records available at UBC's infrastructure development website were missing for all three buildings, however; CIRS building by far showed a better performance at keeping track of its documentation records. Life Sciences Centre comes in second by having documentation records of 6 more features than Forestry Sciences Centre. Forestry Sciences Centre built in 1998 has the most missing documents due to the age of the building and change of contractor at the end of the project.

Only 75% of all parts are assessed through documentation and information found/not found in each case study does not necessarily mean that the building is meeting/not meeting the requirements of one specific feature. Also, 25% of all parts – parts mostly in air, water, and sound concepts – are assessed through onsite performance tests and are not in need of documentation.

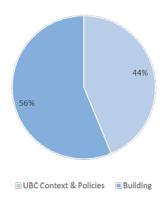

The majority of features not found in all three buildings are in the materials and community concepts. However, CIRS building is showing a far better documentation in air, light, and materials concepts that might lead to successfully obtaining points for those features. All buildings are showing a similar performance in keeping track of documentation addressing mind concept since most of these features are addressed by UBC policies. All three buildings are showing a similar performance in addressing community features such as "health and wellness awareness", "occupant survey", "family support", and so on due to being part of UBC as the context.

Features in movement, mind, and community concepts are mostly addressed by UBC policies and UBC campus as the context. 44% of all features in WELL checklist are addressed by UBC policies and campus design such as site planning and selection, physical activity opportunities, physical activity spaces and

equipment, stress support, restorative opportunities, restorative programming, health services and benefits, community immunity, civil engagement, and so on. 56% of all features are addressed by the building design and how it's operated.

In all ten concepts, the required documentation for each feature may vary, some are part of UBC's policies regarding health and wellbeing and some are defined by design, construction, and operational methods of the building. To illustrate, there are few requirements in nourishment and movement categories that are either established or in need of being established by UBC stakeholders and policy makers such as nutritional transparency, refined ingredients, nutrition education, physical activity opportunities, enhanced ergonomics, and so on. In contrast, there are requirements that are identified through project design documents and reports specially in air, water, light, thermal comfort, sound, and materials concepts such as ventilation effectiveness, handwashing, enhanced daylight access, thermal performance, sound mapping, and outdoor structures. Many of features are addressed by both policies and design documents in all concepts except sound which all features are design related ones.

In addition, UBC is already covering many of WELL requirements through other policies, tools, and design processes. For instance, UBC Wellbeing has already taken measurements regarding nourishment and movement through the "UBC action framework to increase physical activity and reduce sedentary behavior" and the "UBC action framework for a nutritionally sound campus". UBC Wellbeing is also taking

measurements of matters such as built and natural environments through publications and policies such as campus plan, UBC Green Building Plan, etc..., inclusion and connection through "Equity and Inclusion Policies and Guidelines", "Access and Diversity: Academic Accommodation for Students with Disabilities", etc..., and mental health and resilience through publication and policies such as "Student Mental Health Strategy", "Focus on People", and so on.

Summary

To summarize, this project is focusing on the applicability of WELL Building standard to UBC's academic context. By analyzing WELL Standard application to three different buildings on UBC Vancouver campus, including going through their documentation, and site visits, it is evident that UBC is addressing many of WELL features through its own guidelines and policies. However, UBC needs to modify many of these requirements to meet the level of interior environment quality that WELL certification is looking for. And, despite addressing many of the features – both policies and design related ones – there are still some features in nourishment, movement, materials, mind, and community concepts that are not mentioned in any guidelines such as "Refined Ingredients", Self Monitoring", "Enhanced Material Precaution", "Sleep Support", "Occupant Survey", and so on.

Integrated Design Process

For a successful WELL building certification process, the building design process plays an important role. In this study of UBC buildings – CIRS, Life Sciences Centre, and Forestry Sciences Centre – and assessing their documentation availability, CIRS building shows a far better performance than the two other buildings and this is due to its approach towards an integrated design process. Besides demonstrating a better documentation, CIRS building design addresses more WELL features than the others and it seems to be due to the involvement of all parties in an integrated design process from the start of the project.

An integrated design process (IDP) will directly affect the successful performance of a building pursuing WELL certification since many of WELL concepts and features are addressed before the project starts its operation phase of building design. In an Integrated design process since all parties collaborate from the start, many concepts and features can be addressed from early stages of building design. Concepts such as air, water, light, thermal comfort, sound, and materials are all in need of effective collaboration of architectural design team, mechanical, electrical, and pluming engineering teams, and contractor. Besides,

the owner and stakeholders play an important role in defining the project's vision and goals. Also, for every new construction, the stakeholders - if targeting WELL certification - need to collaborate with IWBI from the beginning. WELL Coaching Contacts and WELL Accredited Professional (WELL AP) will help to address all necessary aspects of WELL, guide projects through the certification process, and to further support project administrators.

UBC guidelines

UBC is already addressing many of WELL features through different policies, tools, and design processes. For instance, UBC Wellbeing has already taken measures relating to some of the nourishment and movement concepts through "UBC's action framework to increase physical activity and reduce sedentary behavior" and "UBC's action framework for a nutritionally sound campus". UBC Campus Planning and Wellbeing are also addressing the built and natural environments through publications and policies such as Vancouver Campus Plan, UBC Green Building Plan, etc..., inclusion and connection through "Equity and Inclusion Policies and Guidelines", "Access and Diversity: Academic Accommodation for Students with Disabilities", etc..., and mental health and resilience through publication and policies such as "Student Mental Health Strategy", "Focus on People", and so on. However, UBC needs to take more progressive steps towards educational programs such as nutrition education, light exposure and education, ergonomics education, and so on. Also, UBC will benefit from doing occupant surveys since there are WELL features such as personal thermal comfort that can be easily pursued by having better understanding of what occupants feel about the interior environment.

UBC LEED Implementation Guide

As mentioned before, LEED and WELL work together in sync and there are WELL features aligned with LEED credits. UBC already has its own LEED implementation guideline. One suggestion for UBC would be to either incorporate WELL features into the LEED implementation or create a parallel guideline. By borrowing

concepts from WELL focusing on health and well-being and addressing the quality of interior environment, UBC can make an immense difference in how faculty, staff, and students spend their time indoors.

Green Building Plan

As a leading university focusing on sustainability in Canada and North America, UBC is also launching its own Green Building Plan. In the Green Building Plan, UBC is taking steps towards a net-positive campus addressing ecological and human health through eight concepts. It seems that some of these concepts such as health and well-being, materials and resources, place and experience, biodiversity, and quality can benefit from WELL Building concepts and features to fully move toward a net-positive campus. Currently, for example, there are no requirements in UBC Technical Guidelines for material transparency and features in this concept.

Modifications

The CIRS building is showing a better performance in documenting and addressing material concept due to the idea of the building as a living laboratory on campus which led to incorporating the Living Building Challenge Red List. However, there are no mandatory features required by UBC. UBC can benefit from adding WELL features to its technical guidelines since many of them already exist although many of them are in need of modifications to reach the level of interior environment quality that WELL certification is looking for.

UBC's database

In the end, the WELL certification process to a great extent relies on perfect documentation of the building design from the first day. UBC currently is keeping track of architectural, mechanical, structural, and electrical drawings of every building on campus. However, there is a large amount of information missing from UBC's infrastructure database. It might be due to the fact that there are multiple databases responsible of organizing all this information and they are not directly connected. The current recording system includes many building documents; however, each document is not based on key words so is not

searchable. One last recommendation to UBC would be to enhance its recording database through establishing one single searchable database including every data existing at UBC.

Summary List of recommendations

- Follow Integrated design process for new constructions on campus for a better collaboration among all parties and having a more efficient WELL certification process.
- Add WELL features especially in movement, mind, and community concepts to different UBC
 design and policy guidelines such as "Vancouver Campus Plan" and "UBC's action framework
 to increase physical activity and reduce sedentary behavior" since UBC is already addressing
 some of them.
- Consider publishing a UBC WELL implementation guide aligned with UBC LEED implementation guideline or incorporate WELL features into the LEED implementation guideline to be used in the planning and design of new projects on campus.
- Add WELL features focusing on materials concept such as "fundamental Material Precautions", "Volatile Compound Reduction", and the like to the Green Building Plan since it already includes the materials and resources category.
- Modify UBC technical guidelines since they are addressing many WELL features but not to the same level required by WELL Building Standard.
- Generate one researchable plenary database to better keep track of all documentation required by WELL

Appendix A

☐ Understanding the comparison between WELL v1 and WELL v2 pilot 14

Concepts Comparison

How do the concepts compare between WELL v1 and WELL v2?

The WELL Building Standard version 2 pilot: (WELL v2) has expanded upon the foundation created by WELL v1. WELL v2 is comprised of 112 features within 10 concepts: Air, Water, Nourishment, Light, Movement, Thermal Comfort, Sound, Materials, Mind and Community.

Copyright 0 2018 by International WELL Building Institute PBC. All rights reserve

 $^{^{\}bf 14} \ https://www.wellcertified.com/en/articles/tip-comparison-v1-well-v2-pilot$

Air

Air is the concept that contained the most features in WELL v1. The creation of new concepts in v2, Thermal Comfort and Materials, allowed the remaining Air features to focus more on holistic design strategies to promote clean air and minimize human exposure to harmful contaminants.

Air	v1	v2
Preconditions	12	4
Optimizations	17	10

- Preconditions that are retained in v2 relate to Air Quality Requirements (A01), Smoke-Free Environment (A02), Ventilation Effectiveness (A03) and Construction Pollution Management (A04). Feature 04 is an optimization in v2 with multiple compliance options!
- A new precondition requirement introduced in v2 is to monitor fundamental air parameters (A01).
- Features in v1 (Features 04, 09, 10, 11, 25 and 26) that focus on materials requirements have been moved to the Materials concept in v2.
 - A portion of Feature 16 Humidity Control has moved from Air to Thermal Comfort T07.
 - Portions of Feature 12 Moisture Management have moved to Water concept W07.

Water

Water is one of the concepts that saw the fewest changes in v2. There have been some consolidations and new requirement additions that help make this concept more robust.

Water	v1	v2
Preconditions	5	3
Optimizations	3	5

- The precondition requirements in v1 are still preconditions in WELL v2, but are merged into two features (W01 and W02).
- Similar to the monitoring requirement in the Air concept, Water also has a new requirement to monitor Fundamental Water Properties (W01).
 - New precondition requirements in v2 are thresholds for Cadmium and Chromium (W02).
- Legionella Control (Feature 36) from v1 has been updated to a precondition and a separate feature (W03) in v2.

• v2 also changes the specific threshold requirements for a number of water contaminants: Styrene, Benzene, Toluene, Atrazine and Chlorine.

Nourishment

Nourishment saw a large reduction in the number of preconditions required, providing more flexibility for various types of food service to implement WELL.

Nourishment	v1	v2
Preconditions	7	2
Optimizations	7	11

- Portions of v1 precondition Features 38, 40, and 44 that have been retained in v2 relate to availability of Fruits and Vegetables (N01) and Nutritional Transparency (N02.)
- Precondition Feature 39- Processed Foods, Feature 43- Artificial Ingredients, and Feature 45 Food Advertising have become optimization features in v2.
- Feature 41 Hand Washing, which is a precondition in v1, has been moved to the Water concept as an optimization in v2 (W08.)
 - Features 42, 46, 50, P1 and P7 have been eliminated in v2.
- Additional guidance is provided in v2 for those providing daily snacks and beverages, meals and dining, or no food program.

Light

Light has seen refinements focusing on providing a lighting environment that reduces circadian phase disruption, improves sleep quality and positively impacts mood and productivity. While circadian lighting is no longer a precondition in its v1 form, there is still an emphasis on indoor access to circadian-effective light, either from daylight or electric sources.

Light	v1	v2
Preconditions	4	2
Optimizations	7	6

- Precondition features in v2 relate to visual lighting design and fundamental light exposure. (Feature 54 Circadian Lighting Design is now an optimization in v2.).
- A new requirement as part of LO1 Light Exposure and Education precondition in v2 is to promote lighting education for all projects. We hope this strategy will serve as an important step

to educate building occupants on circadian rhythm, sleep hygiene, age-related increase in light requirements and the importance of daylight exposure on circadian and mental health.

- Other new requirements added as optimizations in the Light concept relate to electric light flicker management (LO7) and enhanced occupant controllability of ambient lighting systems (LO8).
- Features in v1 that are removed in v2 relate to Low-Glare Workstation Design (Feature 57), Surface Design (Feature 59), Daylight Fenestration (Feature 63), Light at Night (Feature P2) and Circadian Emulation (Feature P3).

Movement

The Fitness concept title has been retired in v2, and replaced with Movement. Movement incorporates features from v1's Fitness concept along with some ergonomic requirements that were previously in the v1 Comfort concept.

Movement	v1	v2
Preconditions	2	2
Optimizations	6	10

- A noteworthy update in v2 is the new precondition, V01 Active Buildings and Communities. This precondition can be met by achieving one point from a select list of features in the movement concept (V03, V04, V05, V07, V09). This unique feature structure was established to allow project teams flexibility when selecting what type of strategy promoting movement, physical activity, and/or active living best fits the project's goals.
- Feature 73 Ergonomics: Visual and Physical was found in the Comfort concept in v1, and has now been moved as the other precondition V02 Visual and Physical Ergonomics in the Movement concept in v2. The feature now also requires an educational component to increase occupant awareness about ergonomic comfort and workplace safety.
- New features in the Movement concept relate to Site Planning and Selection (V05) and Enhanced Ergonomics (V10).

Thermal Comfort

Thermal Comfort is now a separate concept in v2, while in v1 the thermal comfort requirements are in the Comfort concept.

Thermal Comfort	v1	v2
Preconditions	n/a	1
Optimization	n/a	6

- The precondition T01 Thermal Performance in v2 is similar to v1 Feature 76 Thermal Comfort. However, in v2, this new feature has additional compliance options and clarifies what design specifications should be submitted for documentation review.
- An added requirement of T01 is to conduct ongoing monitoring of dry-bulb temperature, relative humidity, air speed (for projects using the elevated air speed method) and mean radiant temperature.
- Portion of Feature 16 Humidity Control and Feature 20 Outdoor Air Systems both in the air concept in v1 have been moved to the Thermal Comfort concept in v2.
- A new optimization feature T02 Enhanced Thermal Performance has been introduced in v2.

Sound

Similar to the Thermal Comfort concept, Sound is also a separate concept in v2, while in v1 the acoustic requirements are in the Comfort concept. The Sound concept requirements in v2 has seen refinements while maintaining the v1 feature intents.

Sound	v1	v2
Preconditions	n/a	1
Optimization	n/a	4

- The precondition S01 Sound Mapping in v2 focuses on strategic planning and mitigating acoustical disturbance from both externally and internally generated noise.
- The performance-based features for maximum noise levels in v1 (Feature 74 and 75) have been merged into one optimization in v2 (S02). S02 addresses externally and internally generated noise as background noise and requires that projects meet particular noise level thresholds.

Materials

Materials is a separate concept in v2; while in v1, the materials requirements are included within particular Air and Mind features.

Materials	v1	v2
Preconditions	n/a	3
Optimization	n/a	11

- Preconditions in v2 focus on asbestos, lead, mercury and polychlorinated biphenyl (PCB) restriction and abatement (X01, X02), which all fell under Feature 11 in the Air concept in v1.
- A new precondition requirement has been introduced in v2 (X03) which states that projects must mitigate environmental contamination that results from treated outdoor structures and wood-plastic materials.
- Feature 04 VOC Reduction, a precondition in v1, has now been moved to the Materials concept as two optimization features (X11, X12) and includes multiple compliance options.
 - Other new features added as optimizations in v2 in the materials concept are:
 - o Waste Management (X04)
 - o In-Place Management (X05)
 - o Site Remediation (X06)

Mind

Mind is more narrowly focused on design, policy and programmatic strategies that support cognitive and emotional health in v2, where in v1 it also contained many components of social well-being that are now contained in the Community concept.

Mind	v1	v2
Preconditions	5	2
Optimization	12	13

- The preconditions relate to mental health promotion (M01) and support occupant well-being by incorporating the natural environment through interior and exterior design (M02).
 - New requirements introduced as optimizations in v2 are:
 - o Mental Health Support and Education (M03, M04)
 - o Restorative Spaces, Support and Programs (M06, M07, M08)
 - o Tobacco Prevention and Cessation (M13)
 - o Substance Use Education and Opioid Emergency Response Plan (M14, M15)

Community

Community is a new concept in v2 that covers requirements for equity and social cohesion. Some features in v2's community concept are pulled from the Mind concept in v1, however, the majority of the features in the community concept are new. Community has the most features of any concept in v2.

Community	v1	v2
Preconditions	n/a	3
Optimization	n/a	13

- Features 84, 85 and 86 in the mind concept in v1 are now preconditions in the v2 Community concept.
 - Other new optimizations added in v2 are:
 - o Enhanced Occupant Survey (CO4)
 - o New Mother Support (C09)
 - o Bathroom Accommodations (C14)
 - o Emergency preparedness (C15)
 - o Community Access and Engagement (C16)

Innovations

Innovation features pave way for projects to develop unique strategies for creating healthy environment. Innovations although are existing features in v1, have seen some new additions in v2.

- Projects can pursue up to 10 innovation points (IO1) when registered under v2.
- WELL Accredited Professional (WELL AP) and Educate WELL are now listed as Innovation Features IO2 and IO3.
- New Innovation features added in v2 are Gateways to Wellness (IO4) and Green Building Rating Systems (IO5).

Appendix B

Crosswalks & Alignments

The document outlines a level of fulfilment for each credit and feature in LEED and WELL. A level of fulfilment is assigned as:

When the level of fulfilment is considered equivalent, it indicates that a feature or credit has been evaluated and deemed satisfactory to achieve the complete WELL feature or LEED credit indicated. The awarded feature or credit can be used as verification to achieve the equivalent feature or credit.

When the level of fulfilment is considered partial, it indicates the credit or feature is partly met or may contribute toward the achievement of the associated feature or credit. For example, a WELL part requirement may be met, but the additional parts not satisfied by LEED will need to follow WELL requirements. The awarded LEED credit can be used as verification for the part(s) that have been satisfied. This may also occur in the reverse.

When the level of fulfilment is considered aligned, it indicates that the intent of the credit or feature is aligned, but the requirements do not fully overlap. This may mean that the credit or feature is a good stepping stone for meeting the requirements, but more work may be needed to confirm achievement.
